                                                                                                               Disease protein WIS is lacking most of the V region
                                                                                          MISCELLANDEOUS: Disease protein WIS is lacking most of the V region and all of the CH1 region.

MISCELLANDEOUS: Disease protein ZUC lack most of the V region, all of the CH1 region, and part of the hinge compared with normal gamma-3 heavy chains.

MISCELLANDEOUS: Disease protein OWM may represent an allelic form or another gamma chain subclass.

MISCELLANDEOUS: The hinge region in gamma-3 chains is about four times as long as in other gamma chains and contains three identical 15-residue segments preceded by a similar 17-residue
normally present in the hinge region.
MISCELLANDOUS: The heavy chain disease protein WIS is shown.
MISCELLANDOUS: The sequence of residues 42-76 was taken from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chain dimer).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          chain dimer)

IsoId=P01867-1; Sequence=External;
-!- PTM: O-linked glycan consists of Gal-GalNAc disaccharide which is modified with 2 stainc acid residues.
-!- MISCELLANBOUS: The a allele sequence is shown.
-!- SIMILARITY: Contains 3 immunoglobulin-like domains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                          US-09-401-636-8

Patent No. 6573372

GENERAL INFORMATION

GENERAL INFORMATION

APPLICANT: McCall, Catherine

APPLICANT: Weber, Eric

TITLE OF INVENTION: Feline Immunoglobulin E Molecules and Related Methods

FILE RPERENCE: P-1047

CURRENT APPLICATION NUMBER: US/09/479,614

CURRENT APPLICATION NUMBER: US/09/479,614

CURRENT PILING DATE: 1999-01-07

NUMBER OF SEQ ID NOS: 34

SOFTWARE: PATENTIN Ver. 2.0

SEPTIAND OF SECTION OF SECTION NUMBER: 05-01-07

NUMBER OF SECTION NUMBER: 05-01-07

SOFTWARE: PATENTING DATE: 1999-01-07

Patent No. 6703360

GENERAL INFORMATION

APPLICANT: Heska Corporation

APPLICANT: Tang, Liang A.

TITLE OF INVENTION: COMPOSITIONS AND METHODS RELATED TO CANINE IL-13 R

FILE REFERENCE: AL-7

CURRENT FILING DATE: 2001-04-09

PRIOR PLILONG DATE: 2000-04-07

PRIOR PLILONG DATE: 2000-04-07

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C.Complex: An immunoglobulin heterotetramer subunit consists of two identical light (Kalbain disulfide bonds: In some cases, such as 18A and 19M, the subunits associate into 15.5uperfamily: immunoglobulin C region; immunoglobulin homology
C.Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin

Ig gamma-4 chain C region - human C;Species: Homo sapiens (man) C;Date: 02-Apr-1982 #sequence_revision 02-Apr-1982 #text_change 09-Jul-2004 C;Accession: A90933; A00549; A00150 R;Ellison, J.; Buxbaum, J.; Hood, L.

RESULT 14 G4HU

```
A)Consolution: 14932.33-14932.33
A)Map position: 1401/11/12.21/1
C)Complex: An immunoglobulin heterotetramer subunit consists of two identical light (ka hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into l C)Superfamily: immunoglobulin cregion; immunoglobulin homology <IMJ-
E)20-85/Domain: immunoglobulin homology <IMJ-
E)39-110/Region: hinge
E)34-203/Domain: immunoglobulin homology <IMJ-
E)144-203/Domain: immunoglobulin homology <IMJ-
E)134-203/Domain: immunoglobulin homology <IMJ-
E)144/Disulfide bonds: interchain (to light chain) #status experimental
E)177/Binding site: carbohydrate (Asn) (covalent) #status predicted
